

A how-to guide and general information to help you get the most out of this file.

How to Add Your Design ?

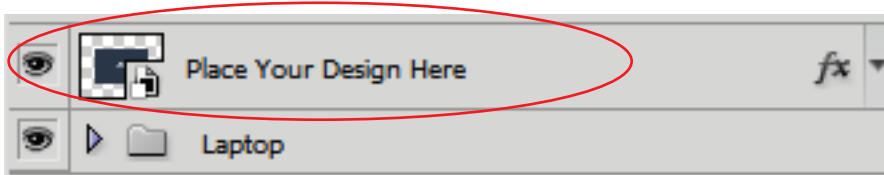

1. Once you open one of the photoshop files, you will find the following layers.

2. Layers are named at the name of each device. To add your design, open the layer with the device name you want. To add the Laptop design for example, right click on the Laptop layer and choose “edit content”.

3. Once you click “edit content”, a new window will open that contains the Laptop device. Again on layers, point to the first layer, right click on it and choose edit content. A new window will open where you will be able to paste your design.

4. Save all changes in the opened windows and return to your main photoshop file. You will find that the design is updated on the laptop device. Repeat the previous steps for your other devices.

thank you.
